ARENA is a minimalist survival arcade game focused on reflex, precision, and fast-paced gameplay. Players control a sphere and survive against increasing enemy pressure. The project emphasizes skill-based challenge, responsive controls, and optimized mobile performance.

Objective

- **Develop a skill-based survival game.**
- Create engaging gameplay with increasing difficulty.
- Ensure smooth, low-CPU performance.
- Provide responsive touch controls.
- Deliver a lightweight and scalable mobile game.

- **Designed the game using a modular development approach.**
- **Implemented core mechanics including player movement, enemy spawning, and collision detection.**
- **Used iterative development for testing gameplay balance and responsiveness.**
- **Applied performance optimization techniques for smooth execution.**
- **Evaluated the system through functionality and gameplay testing.**

- **React Native** — A cross-platform mobile app development framework created by Meta Platforms that allows developers to build Android and iOS applications using JavaScript and React with a single codebase.
- **Expo** — A development platform and toolkit for React Native that simplifies app creation, testing, and deployment by providing ready-to-use tools and services.
- **TypeScript** — A strongly typed programming language built on JavaScript that improves code quality, readability, and error detection during development.

Key Findings

- Minimalist mechanics can create engaging gameplay.
- Optimized architecture improves performance and responsiveness.
- Skill-based difficulty increases replayability.
